

Black Resin Epoxy Filling

We use a two part epoxy filler with a black pigment to fill the larger bolt holes and other evidence of former use to ensure that the timber is supplied to the standard and application specified on the order.

The Resin is used to help make the hardwood meet the Premium Grading and assist in stopping the water from pooling in the features. It is also sometimes used for visual effect as it highlights the features of the timbers' former life.

When the Resin is sanded or handbrushed it appears a dull grey which will turn to black once coated. Manufacturers recommendations.

If using timbers externally, Recycled Timbers recommend specifying class 1 durability timbers.
